An ampere (A) is a measure for electric current. A kelvin (K) is a measure for temperature. A mole (mol) is the amount of substance (based on number of atoms rather than mass.) A candela (cd) is a measure for luminous intensity. The Lumen (lm) is a measure unit for total amount light visible for the human eye emitted by a source.

The most common measurement system you see in introductory physics is the meter-kilogram-second (MKS) system, referred to as SI (short for *Système International d'Unités*, the International System of Units), but you may also come across the foot-pound-second (FPS) system.

Measurement is the process of finding the length, size, or quantity of a substance. Since ancient times, people have used several ways to measure length. A physical quantity (like length) has to be measured with respect to some fixed quantity. A fixed quantity with respect to which a physical quantity is measured is called a unit.

For that reason, physics uses a number of measurement systems, such as the CGS (centimeter-gram-second) system and the MKS (meter-kilogram-second) system. You also use the standard English system of inches and feet and so on — that's the FPI (foot-pound-inch) system. The most common measurement system in introductory physics is the MKS system.

It is an intriguing fact that some physical quantities are more fundamental than others and that the most fundamental physical quantities can be defined only in terms of the procedure used to measure them. The units in which they are measured are thus called fundamental units. In this textbook, the fundamental physical quantities are taken to be length, mass, time, and electric current.
